

Machine Learning vs. Artificial Intelligence

Artificial intelligence and Machine learning are very important and also used to make computers perform smart tasks.

Artificial intelligence helps to machines think and act like human and Ai can solve the problems and understand languages(Eg: Siri, Alexa) and can make decisions.

On the other hand, Machine Learning is a subset of Ai. The computer system improves automatically through experience and data.(youtube and Instagram recommendations, Face recognition).

In fact, Ai includes more subsets such as Machine Learning, deep learning, Natural Learning Processing (NLP) , Computer Vision, Robotics, Neural Networks, Reinforceent Learning.

Ai is the broad field of intelligent system , focuses on human like intelligence, can use rules and logic, special goal is smart and best decision making, however Machine Learning is a subset of Ai, focuses on learning from data, uses algorithms and data, the special goal is improving the accuracy.

Point of my view, Ai is the wider technology used to create intelligent machines but ML is a part of Ai that allows systems to learn from data. Actually, Ai depend on Machine Learning because of it's ability. Both Ai and ML are very important in modern applications and developments.
